

**FIRE & EMERGENCY
TRAINING**

Martha Cove – Underpass Training Course

Course Outline

- **Explanation of the Underpass**
- **Expectations & Assumptions**
- **OJT Practical Demonstration**

Explanation of the Underpass

Explanation of the Underpass

The Martha Cove Underpass, located in Safety Beach on the Mornington Peninsula, is a notable infrastructure project designed to facilitate both vehicular and maritime traffic.

Completed in August 2005 at a cost of approximately \$25 million, the underpass allows Marine Drive roadway to pass beneath the entrance channel connecting the inland Martha Cove marina to Port Phillip Bay

This enables uninterrupted boat access to the Marina, as the cars travel underneath the water.

A bridge or “overpass” was rejected because of the heights of yacht masts.

The underpass is a major infrastructure, which is subject to flooding if pumps are not working.

Expectations & Assumptions

Expectations & Assumptions

Expectations

All guards must read and familiarise themselves with the site SOP's, specifically for this course, reading and understanding the document:

Marine Drive Underpass Incident Management Plan – OP25 Version 6.0 - August 2023

Assumptions

All new starters require on-the-job training with an existing qualified senior guard. It is expected that this has been undertaken within the first 30 days of employment for full time staff, and within the first 45 days of employment for casual staff. In anycase, it must be undertaken before undertaking the test.

OJT Practical Demonstration

OJT Practical Demonstration

Once SOP **Marine Drive Underpass Incident Management Plan – OP25** has been read and understood, all new starters require on-the-job training with an existing qualified senior guard. This is practical demonstration, on site, and at location. It is expected that you can confidently demonstrate the following:

- 1) *Explain point out camera locations in the under-pass areas how these could be utilised in a situation*
- 2) *Liley areas of unauthorised access and how this should be checked*
- 3) *Where the lift control cabinets are*
- 4) *Storm water pump, what we do with them and where they are located what action should be taken in the event of a fault*
- 5) *What services or facilities could be required to stop traffic entering the tunnel /underpass*
- 6) *Give Explanation of how you would conduct a power reset of lifts including keys and process followed*

When both the theory and practical have been undertaken, you will be ready to undertake the test.
